

Day 22 – HR Screening Dataset Creation

Zecpath AI Internship Documentation · Three Core Deliverables

1. HR Screening Question Dataset

A compact AI-ready HR screening question bank was implemented for automated screening. The dataset contains 30 questions across seven required categories. Each question includes an identifier, category, question text, expected answer type, mandatory status, and scoring importance.

Property	Implemented value
Dataset	Zecpath HR Screening Question Bank
Version	1.0
Language	English; structure is multilingual-ready
Total questions	30
Categories	7

Question Categories

Category	Purpose
Introduction	Understand the candidate's background and interest in the role
Education	Verify educational qualifications and certifications
Experience	Evaluate professional experience and previous responsibilities
Skills	Identify technical skills, tools, technologies, and relevant projects
Location	Check candidate location and relocation or work-mode compatibility
Salary	Understand compensation expectations and alignment
Notice Period	Determine candidate availability and potential joining date

2. Question Category Mapping

The seven screening categories are mapped in config/screening_rules.json with a purpose and priority. This separates screening rules from the individual question records and supports future workflow changes.

Category	Priority	Purpose
Introduction	High	Understand the candidate's background and interest in the role
Education	Medium	Verify educational qualifications and certifications
Experience	High	Evaluate professional experience and previous responsibilities
Skills	High	Identify technical skills, tools, technologies, and relevant projects
Location	Medium	Check candidate location and relocation or work-mode compatibility
Salary	Medium	Understand compensation expectations and alignment
Notice Period	High	Determine candidate availability and potential joining date

3. AI Conversation-Ready Question Objects

The screening_ai/question_engine.py implementation loads the 30-question dataset and converts each record into an object ready for a future automated screening conversation flow. Verified execution produced 30 AI conversation objects.

Field	Purpose
question_id	Unique identifier for the screening question
category	Screening category used by the conversation flow
prompt	Question text presented to the candidate
expected_answer_type	Expected response format
mandatory	Whether the question is required
scoring_importance	Low, medium, or high evaluation importance

Verified Implementation Result

AI Conversation Objects: 30

The implementation was executed successfully and the first generated objects were verified, including question ID, category, prompt, expected answer type, mandatory status, and scoring importance.

Implemented file	Deliverable
data/hr_screening_questions.json	30-question HR screening dataset
config/screening_rules.json	Seven-category mapping and priorities
screening_ai/question_engine.py	Loads questions and builds conversation-ready objects

Day 22 Deliverables Status: COMPLETED

- 1. HR Screening Question Dataset ✓

2. Question Category Mapping ✓

3. AI Conversation-Ready Question Objects ✓
