1.ATS scoring engine

```
ats_score.py > ...
1  import json
2
3  # Load weights
4  with open("config/weights.json", "r") as file:
5      weights = json.load(file)
6
7  # Select the role
8  role = "AI Engineer"
9  role_weights = weights[role]
10
11 # Candidate scores
12 candidate = {
13     "skill_match": 90,
14     "experience_relevance": None, # Try changing this to 80 later
15     "education_alignment": 100,
16     "semantic_similarity": 85
17 }
18
19 # Handle missing values
20 for key, value in candidate.items():
21     if value is None:
22         candidate[key] = 0
23
24 # Calculate contribution of each parameter
25 skill_score = candidate["skill_match"] * role_weights["skill_match"] / 100
26 experience_score = candidate["experience_relevance"] * role_weights["experience_relevance"] / 100
27 education_score = candidate["education_alignment"] * role_weights["education_alignment"] / 100
28 semantic_score = candidate["semantic_similarity"] * role_weights["semantic_similarity"] / 100

32     skill_score +
33     experience_score +
34     education_score +

2.Configurable weight system

```
